

ABSTRACT OF THE DISCLOSURE

1
2
3 A digital computer system for displaying a computer generated terrain
4 representing a 3-dimensional depiction of the real world terrain surrounding a vehicle in
5 real-time while the vehicle is in motion. This 3-D (3-Dimensional) image is rendered in
6 real time while the vehicle is in motion and uses Global Positioning System (GPS) or
7 differential GPS (dGPS) data available from a GPS unit and translates that data into
8 virtual space within an Image Generation Processing block of the digital computer
9 system. The digital computer system generates a virtual world 3-D image representing
10 the eye-point position of the vehicle and directional vector into a terrain database.
11 Using the latitude, longitude, and altitude supplied from the GPS unit as the eye point
12 position into a virtual world using a terrain database, the Image Generation Processing
13 block has a render engine capable of rendering a depiction of the terrain outside of the
14 vehicle, as would be seen in high visibility conditions, regardless of weather, lighting
15 and atmospheric conditions.
